

# Case Study Report: 3-Class IMDb Sentiment Classification

**Name:** Özgür Çoban

**Date:** November 11, 2025

**For:** Senswise

## Summary

**Method:** I trained and evaluated two baseline BERT models (92% and 93% accuracy). I then designed three distinct heuristic systems (Ratio, Logit, and Weighting) to build a 3-class classifier on top of these models.

**Results:** The Positional Weighting (System 3), was the winner. It proved to be the most accurate, reducing critical errors by over 80%. This system identifies mixed reviews by applying a 2x weight to the first and last sentences.

## 1. Project Objective

The project was done in two main parts:

- **Part 1:** Train binary classifiers on the available data.
- **Part 2:** Use the trained binary models and apply NLP techniques to analyze a review sentence by sentence and infer a final "Mixed," "Positive," or "Negative" label.

## 2. Methodology

### Part 1: Binary Classifier Training

Two separate BertForSequenceClassification models were fine-tuned using the bert-base-uncased pre-trained weights.

- **Dataset:** The imdb dataset (25,000 training reviews, 25,000 test reviews).
- **Preprocessing:** Two tokenized datasets were created:
  - A 256 token model where reviews were truncated to a max length of 256 tokens for speed.
  - A 512 token model where reviews were truncated to the BERT maximum of max length of 512 tokens.
- **Training Parameters:**
  - Epochs: 2
  - Batch Size: 128
  - Learning Rate: 5e-5

### Part 2: 3-Class System Design

The trained binary models were used as sentence-level classifiers within three systems. All systems use NLTK's sent\_tokenize.

- **System 1 (Ratio):** A baseline system. It classifies each sentence as 0 or 1. A review is "Positive" if the ratio of positive sentences is  $\geq 0.7$ , "Negative" if the negative ratio is  $\geq 0.7$ , and "Mixed" otherwise.
- **System 2 (Logit):** A confidence-based system. It analyzes the model's raw logits for each sentence.
  - If  $(\text{pos\_score} - \text{neg\_score}) < 1.0$ , the sentence is "Neutral."
  - A review is "Mixed" if it has at least 2 confident "Positive" *and* 2 confident "Negative" sentences.
- **System 3 (Weighting):** A heuristic-based system. It gives a positional\_weight of 2 to the first and last sentences (and a weight of 1 to all others).
  - A review is "Mixed" if the weighted positive score is  $\geq 2$  and the weighted negative score is  $\geq 2$ .

### 3. Results and Analysis

#### Part 1: Binary Model Performance

Both models were evaluated on the 25,000-sample test set for their binary classification performance.

##### Binary Classification Report (256-Token Model):

| Metric       | Precision | Recall | F1-Score | Support |
|--------------|-----------|--------|----------|---------|
| Negative (0) | 0.95      | 0.88   | 0.91 ▾   | 12500 ▾ |
| Positive (1) | 0.89      | 0.95   | 0.92 ▾   | 12500 ▾ |
| Accuracy     |           |        | 0.92 ▾   | 25000 ▾ |
| Macro Avg    | 0.92      | 0.92   | 0.92 ▾   | 25000 ▾ |
| Weighted Avg | 0.92      | 0.92   | 0.92 ▾   | 25000 ▾ |

##### Binary Classification Report (512-Token Model):

| Metric       | Precision | Recall | F1-Score | Support |
|--------------|-----------|--------|----------|---------|
| Negative (0) | 0.93      | 0.93   | 0.93 ▾   | 12500 ▾ |
| Positive (1) | 0.93      | 0.93   | 0.93 ▾   | 12500 ▾ |
| Accuracy     |           |        | 0.93 ▾   | 25000 ▾ |
| Macro Avg    | 0.93      | 0.93   | 0.93 ▾   | 25000 ▾ |

|              |      |      |        |         |
|--------------|------|------|--------|---------|
| Weighted Avg | 0.93 | 0.93 | 0.93 ▾ | 25000 ▾ |
|--------------|------|------|--------|---------|

**Part 2: 3-Class System Comparison (1,000-Sample Test on 512-Token Model)**

The three heuristic systems were run on a 1,000-review random sample using the 512-token model to determine the best-performing logic.

**3.1. Overall Classification Distribution**

| System               | POSITIVE | NEGATIVE | MIXED | NEUTRAL |
|----------------------|----------|----------|-------|---------|
| System 1 (Ratio)     | 34.8%    | 24.8%    | 40.4% | 0.0%    |
| System 2 (Logit)     | 30.7%    | 25.9%    | 42.5% | 0.9%    |
| System 3 (Weighting) | 20.0%    | 10.3%    | 69.7% | 0.0%    |

**3.2. Agreement with True Binary Labels**

| System 1 (Ratio) vs. True Labels: | MIXED | NEGATIVE | POSITIVE |
|-----------------------------------|-------|----------|----------|
| NEGATIVE                          | 255   | 239      | 18       |
| POSITIVE                          | 149   | 9        | 330      |

| System 2 (Logit) vs. True Labels: | MIXED | NEGATIVE | NEUTRAL | POSITIVE |
|-----------------------------------|-------|----------|---------|----------|
| NEGATIVE                          | 243   | 246      | 5       | 18       |
| POSITIVE                          | 182   | 13       | 4       | 289      |

| <b>System 3<br/>(Weighting) vs. True<br/>Labels:</b> | <b>MIXED</b> | <b>NEGATIVE</b> | <b>POSITIVE</b> |
|--|--------------|-----------------|-----------------|
| NEGATIVE   | 405          | 101             | 6               |
| POSITIVE   | 292          | 2               | 194             |

### 3.3. Hard Error Analysis

A "hard error" is a complete misclassification (e.g., classifying a "True Positive" as "Negative").

| <b>System</b>        | <b>Hard Error Count (out of 1000)</b> |
|----------------------|---------------------------------------|
| System 1 (Ratio)     | 27 (18 + 9)                           |
| System 2 (Logit)     | 31 (18 + 13)                          |
| System 3 (Weighting) | 8 (6 + 2)                             |

**Analysis:** System 3 (Weighting) is the winner in terms of accuracy on this model. This demonstrates that giving 2x weight to the first and last sentences is a highly effective heuristic.

### 3.4. Validation of System 3 (10,000-Sample Test on 256-Token Model)

To validate the winning heuristic (System 3), ran on a larger 10,000-sample test using the faster 256-token model.

#### **System 3 (Weighting) Distribution (Sample size=10000):**

| <b>Label</b> | <b>Percentage</b> |
|--------------|-------------------|
| MIXED        | 61.48%            |
| POSITIVE     | 28.27%            |
| NEGATIVE     | 10.25%            |

### System 3 (Weighting) vs. True Labels (Sample size=10000):

|          | MIXED | NEGATIVE | POSITIVE |
|----------|-------|----------|----------|
| NEGATIVE | 3885  | 1009     | 110      |
| POSITIVE | 2263  | 16       | 2717     |

### System 3 (Weighting) Hard Errors (Sample size=10000): 126

**Analysis:** The larger test confirms our initial findings from the 1,000-sample runs.

- **Consistent Sensitivity:** The "Mixed" classification rate remained stable (69.7% in the 1k 512-model sample vs. 61.5% in the 10k 256-model sample).
- **Consistent Accuracy:** The "hard error" rate also remained stable and low at 1.26% (126 / 10000).

## 4. Conclusion

All three systems successfully inferred a "Mixed" category, but with different behaviors.

- System 1 (Ratio), was a decent baseline but had a high hard error rate.
- System 2 (Logit), was a good balance of accuracy and sensitivity, and was the only system to identify truly "Neutral" reviews.
- System 3 (Weighting), was the winner. It proved to be the most accurate system, reducing hard errors significantly on both the 256-token and 512-token models. This finding was validated on a larger 10,000-sample test.
